Re: Fracking Water

Dear Editors,

The controversy over "fracking" for increasing natural gas production is easily solved. Simply require that gas producers may inject as much fluid into the ground as they want, so long as that fluid is potable drinking water. Unless of course these injections adversely affect nearby wells over the course of time.

But that won't happen or so we've been told, correct? Therefore, if no adverse effects are observed, then gas companies and their ilk may inject as much drinking water into the ground as they like. Problem solved.
